

Energy

Energy is essential for social and economic prosperity, and technological developments have opened new possibilities for improving how we provide power to people worldwide.

ACN is well-positioned to respond to the changing landscape of today's renewable energy focus. Our renewable energy division aims to provide energy to society from green natural resources ranging from the force of the wind to the power of the sun.

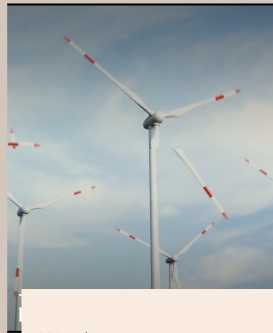

ACN provides support to customers as they navigate changes in energy use, technological advancement, financial concerns, and an increasing focus on environmentally friendly solutions. Our pledge to you is to work together to make today's political and societal momentum for energy change a reality, and to ensure that our planet survives for many generations to come.

Our development strategy entails establishing strong and early ties with all stakeholders. We are consultative and honest, and we take pride in getting to know the community to ensure that local people benefit from the project, whether through job creation, new company investment, or infrastructural improvements.

Solar

As global energy demands increase, solar power will play a bigger role in the global energy system. Solar power is the world's fastest-growing energy source due to falling costs and rising demand for renewable energy.

Wind

Due to wind energy's substantial price decline in recent years, new wind farms are less expensive than gas or coal power plants. Wind turbines are now more effective and durable because of technological advancements.
